RENEWAIRE ENERGY RECOVERY VENTILATION & IAQ

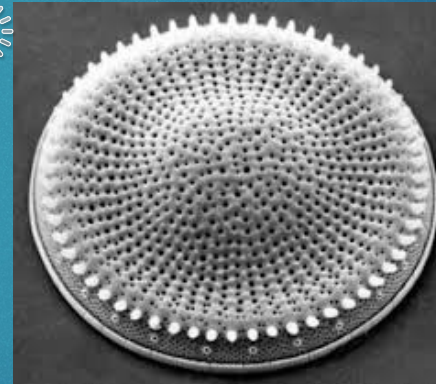

Can we justify more mechanical ventilation?
If so, why, how & what's next?

What we don't know! We can always learn!

- ▶ 40% of cars in cities are looking for parking spots.
- ▶ Rainforest O₂ used for what?
- ▶ Diatoms is what produces Oxygen for the world!

- ▶ **Side note;** 2/3's of kids today will do jobs we don't have today!
- ▶ 90 – Latitude = Ground Temperature!

IAQ & Ventilation in Perspective

- ▶ Structures have become tighter with lower infiltration
 - ▶ In early 1900s, there were approximately 50 materials used for construction. By less than 100 years later, this list had grown to about?
 - ▶ **55,000 materials!**

+ Raw GJ. *Sick building syndrome: a review of the evidence on causes and solutions*. HSE Contract Research Report no. 42. Building Research Establishment, Garson Watford, 1992.

++ ERT Associates. *Asthma and weatherization in Maine*. National Center for Healthy Housing, 2006.

Trivia

- ▶ How much water do we drink daily?
 - ▶ 4 lbs.
- ▶ How much food do we eat daily?
 - ▶ 4 lbs.
- ▶ How much air do we breathe daily?
 - ▶ 31 lbs.

79 70 89

- ▶ Average life?
 - ▶ 79 years
- ▶ 20 years in nonresidential buildings
- ▶ 50 years in homes (Residential)
- ▶ 89% of an average life is inside the built environment

INDOOR AIR IS 2X-5X AND AS MUCH AS 100X MORE POLLUTED (EPA)

HISTORY OF VENTILATION

- EARLY HUMANS - FIRE AND SMOKE
- EGYPTIAN STONE CARVERS
- MIDDLE AGES – DISEASES
- 1775 – LAVOISIER – CO₂
- 1970'S DUE TO THE ENERGY CRISIS, TO CONSERVE ENERGY IN THE US REDUCES VENTILATION RATES
- LED TO “SICK BUILDING SYNDROME”

Why Ventilate – Contaminates

What Always Comes to Mind

- ◆ Moisture and Mold
- ◆ Odor

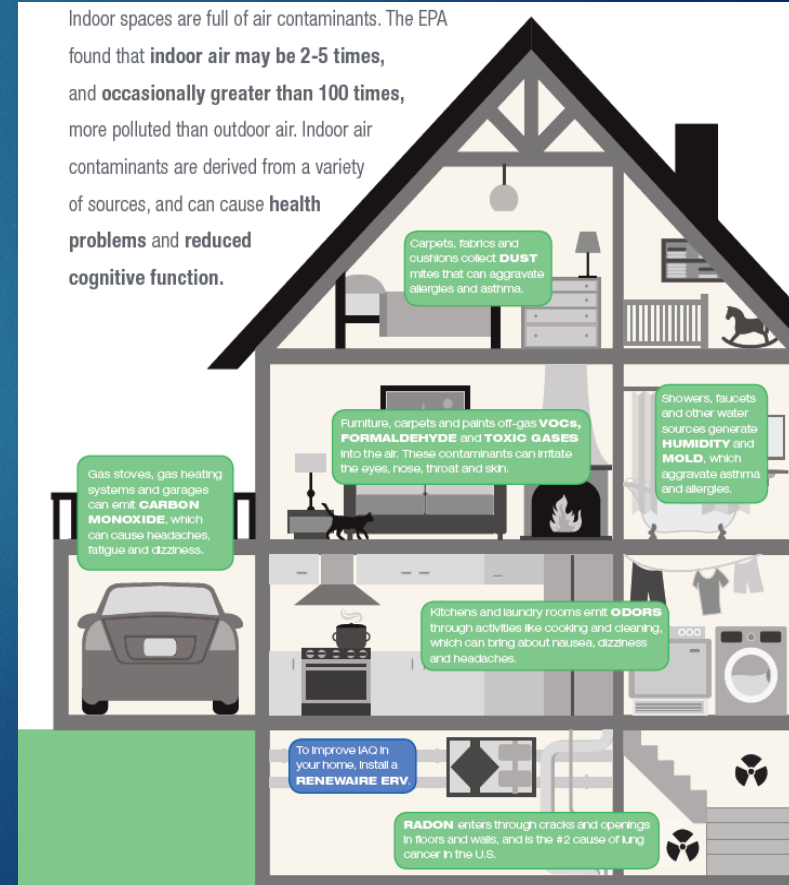

What Often Comes to Mind

- ◆ Carbon Monoxide
- ◆ Carbon Dioxide
- ◆ Radon

What Occasionally Comes to Mind

- ◆ Particles (PM2.5)
- ◆ Nitrogen Dioxide
- ◆ Formaldehyde
- ◆ Ozone
- ◆ TVOC or SVOC

PM 2.5 PARTICULATES

8

PM 2.5 particulates are receiving increased focus by code influencers

Small size and ability to suspend in the air make them particularly troublesome

Filter effectiveness measures increasingly use PM 2.5 as a measuring stick for particulate removal

IAQ – WHERE IS THE DEFICIENCY

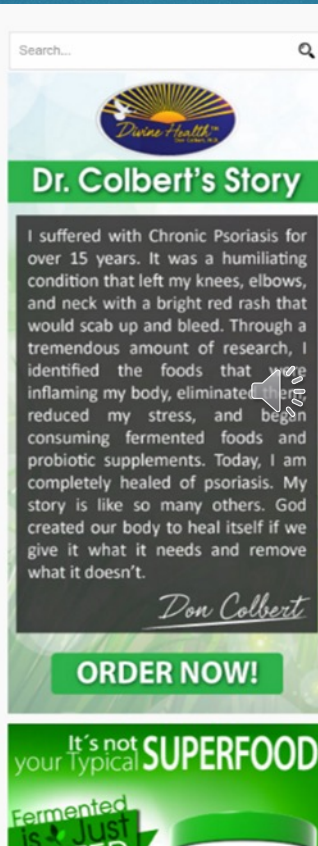

STUDY: ALARMING RESULTS FOUND IN SCENTED LAUNDRY DETERGENTS

11 APRIL 2016 2401 AUTHOR: DR. DON COLBERT Share 19

Air Quality, Atmosphere, & Health recently published a study concerning air dryer vent emissions. Top selling products were used in the research project including scented laundry detergent and dryer sheets. The main researcher who found carcinogens in the liquid and sheets also led the dryer vent study.

Cancer Causing Concerns

Divine Health

Dr. Colbert's Story

I suffered with Chronic Psoriasis for over 15 years. It was a humiliating condition that left my knees, elbows, and neck with a bright red rash that would scab up and bleed. Through a tremendous amount of research, I identified the foods that were inflaming my body, eliminated them, reduced my stress, and began consuming fermented foods and probiotic supplements. Today, I am completely healed of psoriasis. My story is like so many others. God created our body to heal itself if we give it what it needs and remove what it doesn't.

Don Colbert

ORDER NOW!

It's not your typical **SUPERFOOD**

Fermented is just

Analysis of captured gases found more than twenty-five (25) volatile organic combinations which included seven (7) hazardous pollutants. Two of the chemicals, acetaldehyde, and benzene are grouped as carcinogens by the Environmental Protection Agency

Interestingly, there are no regulations on dryer vent emission. According to the research study, emission from the dryer vents (using the top five brands of laundry soap detergent) in the Seattle (Washington) area alone would constitute six percent (6%) of automobile emission of acetaldehyde.

IMPACT OF COVID-19 ON VENTILATION DESIGN

- ▶ CODES WILL EVENTUALLY REACT TO THE “NEW NORMAL” OF VIRUS MANAGEMENT
- ▶ LOOK FOR STRONGER FILTRATION AND HIGHER MINIMUM VENTILATION REQUIREMENTS
- ▶ DECOUPLED VENTILATION IS MOVING TOWARD STANDARD DESIGN PRACTICE
- ▶ BUILDING OWNERS WILL CALL FOR PROTECTION FROM LEGAL EXPOSURE
- ▶ A WHOLISTIC SYSTEM APPROACH TO HVAC IS MORE IMPORTANT THAN EVER
- ▶ <https://www.msn.com/en-us/Video/tuned-in/how-a-restaurants-ventilation-system-can-affect-the-spread-of-the-coronavirus/vi-BB13Ysxa?ocid=ientp>
- ▶ <https://globalnews.ca/news/6940893/staff-infected-vigi-mont-royal-residence-ventilation/>

- Increase outdoor air **ventilation** (use caution in highly polluted areas); with a lower population in the building, this increases the effective dilution **ventilation** per person.
- Disable demand-controlled **ventilation** (DCV).
- Further open minimum outdoor air dampers, as high as 100%, thus eliminating recirculation (in the mild

Statement on operation of heating, ventilating, and air-conditioning systems to reduce SARS-CoV-2 transmission: **Ventilation and filtration provided by heating, ventilating, and air-conditioning systems can reduce the airborne concentration of SARS-CoV-2 and thus**

COVID-19

Ventilation in Buildings

Updated Mar. 23, 2021

[Print](#)

Summary of Recent Changes

Updates as of March 23, 2021

- Simplified language in the overall list of tools to improve ventilation.
- Added three new Frequently Asked Questions (FAQs) on the usefulness of carbon dioxide monitors to inform ventilation decisions, the usefulness of temperature and relative humidity to control the spread of COVID-19, and the use of fans indoors.
- Expanded the FAQ on emerging technologies to include more products available on the market.
- Added additional information with simple calculations to the FAQ on portable HEPA air cleaners to help consumers choose appropriate units for their spaces.

CDC recommends a layered approach to reduce exposures to SARS-CoV-2, the virus that causes COVID-19. This approach includes using multiple mitigation strategies, including improvements to building ventilation, to reduce the spread of disease and lower the risk of exposure. In addition to ventilation improvements, the layered approach includes [physical distancing](#), [wearing face masks](#), [hand hygiene](#), and [vaccination](#).

LATEST CDC GUIDELINES

Many new air disinfection devices are marketed for their ability to inactivate SARS-CoV-2. How can I tell if they work as advertised? ^

CDC does not provide recommendations for, or against, any manufacturer or product. There are numerous technologies being heavily marketed to provide air cleaning during the ongoing COVID-19 pandemic. Common among these are ionization, dry hydrogen peroxide, and chemical fogging disinfection. Some products on the market include combinations of these technologies. These products generate ions, reactive oxidative species (ROS, which are marketed using many names), or chemicals into the air as part of the air cleaning process. People in spaces treated by these products are also exposed to these ions, ROS, or chemicals.

While variations of these technologies have been around for decades, relative to other air cleaning or disinfection methods, they have a less-documented track record when it comes to cleaning/disinfecting large and fast volumes of moving air within heating, ventilation, and air conditioning (HVAC) systems or even inside individual rooms. This does

www.cdc.gov/coronavirus/2019-ncov/community/ventilation.html

Ventilation in Buildings | CDC

not necessarily imply the technologies do not work as advertised. However, in the absence of an established body of peer-reviewed evidence showing proven efficacy and safety under as-used conditions, the technologies are still considered by many to be “emerging.”

As with all emerging technologies, consumers are encouraged to exercise caution and to do their homework. Registration alone, with national or local authorities, does not always imply product efficacy or safety. Consumers should research the technology, attempting to match any specific claims against the intended use of the product. Consumers should request testing data that quantitatively demonstrates a clear protective benefit and occupant safety under conditions consistent with the intended use. When considering air cleaning technologies that potentially or intentionally expose building occupants, the safety data should be applicable to all occupants, including those with health conditions that could be aggravated by the air treatment. In transient spaces, where average exposures to the public may be temporary, it is important to also consider occupational exposures for workers that must spend prolonged periods in the space.

Road to Clean Air - Electric Vehicle Report

Stand Up For Clean Air Initiative

The key to fixing problems in the indoor air at work are these steps. They take time to work through, but they are core to healthy indoor air.

1. Identify the source(s) of the problem.

Many sources can be removed or kept out of the workspace once identified. However, several sources may combine to become a more serious problem together than they are separately. Are some rooms worse than others or is the problem occur more frequently when some activity occurs?

2. Remove the source of the problem.

Depending on the source, this can be easy (for example, remove the garbage) or may take more work (for example, switch cleaning chemicals). Make sure the workplace is 100 percent tobacco-free. Clean damaged or dirty materials. Remove and replace materials too saturated or damaged to be adequately cleaned. For example, drywall or carpeting that has been flooded will likely need replacing rather than just cleaning.

3. Make sure the ventilation system is working correctly and that air flow is not blocked.

Inadequate ventilation is one of the most common causes of problems with indoor air in a workplace.¹

For more information about solving indoor air problems, check out these tools available online. They are designed to help building professionals investigate and solve indoor air problems in the workplace.

IA-Quest: indoor air quality emission simulation tool

From: [National Research Council Canada](#)

Overview of the tool

Canadians spend 90% of their time indoors, making indoor air quality (IAQ) an important issue. Testing conducted at the National Research Council (NRC) has identified building materials as key sources of indoor pollutants. Controlling these sources is the most effective strategy to improving IAQ.

Experts at the NRC have developed indoor air quality prediction software called IA-Quest (Indoor Air Quality Emission Simulation Tool). IA-Quest provides a database of materials and their measured emissions, allowing materials to be selected based on low emissions. In addition, the tool predicts the emission of volatile organic compounds (VOCs) from building materials and furnishings, helping to quantify the effect of low-emission materials and effective ventilation strategies on IAQ.

IA-Quest users can:

- browse a database of measured emission characteristics for various building materials
- query and search the database

Energy Recovery Ventilation

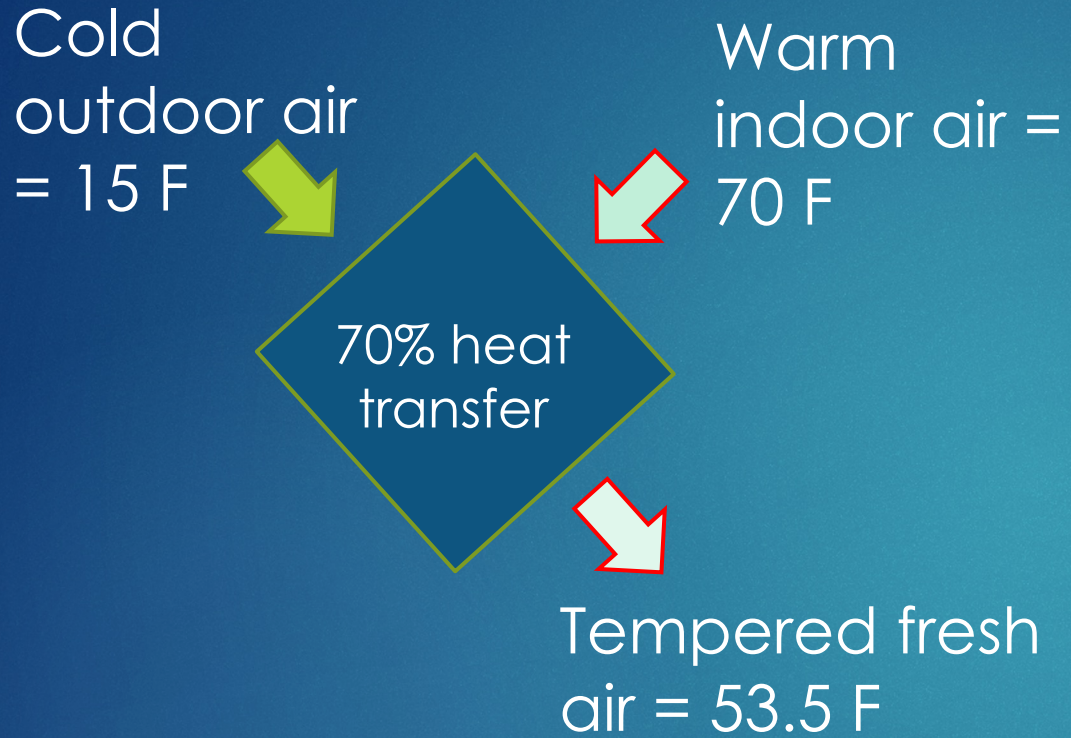

Maintains desired OA
ventilation and enhanced
IAQ with minimal energy
penalty

ENERGY RECOVERY VIA STATIC PLATE

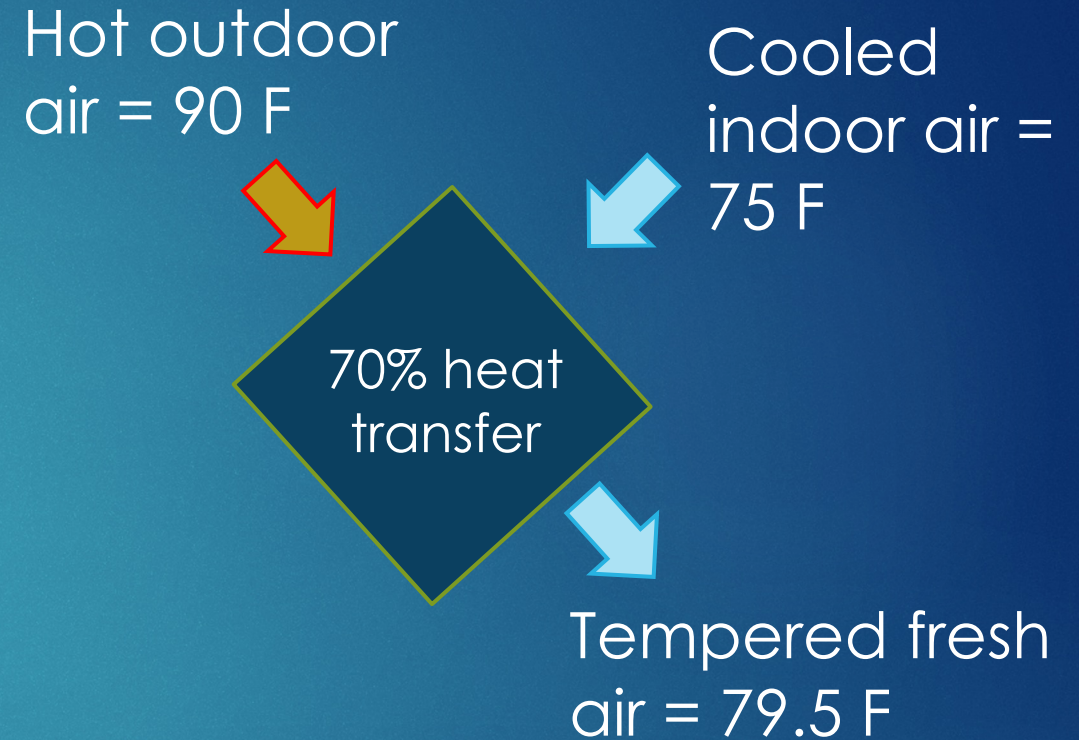

STATIC-PLATE CORE ALLOWS EXHAUST AND OUTSIDE AIR STREAMS TO PASS THROUGH THE CORE, TRANSFERRING BOTH HEAT AND MOISTURE IN THE PROCESS.

Vancouver Performance Example

Winter Example

Summer Example

Economics of ERV in Vancouver

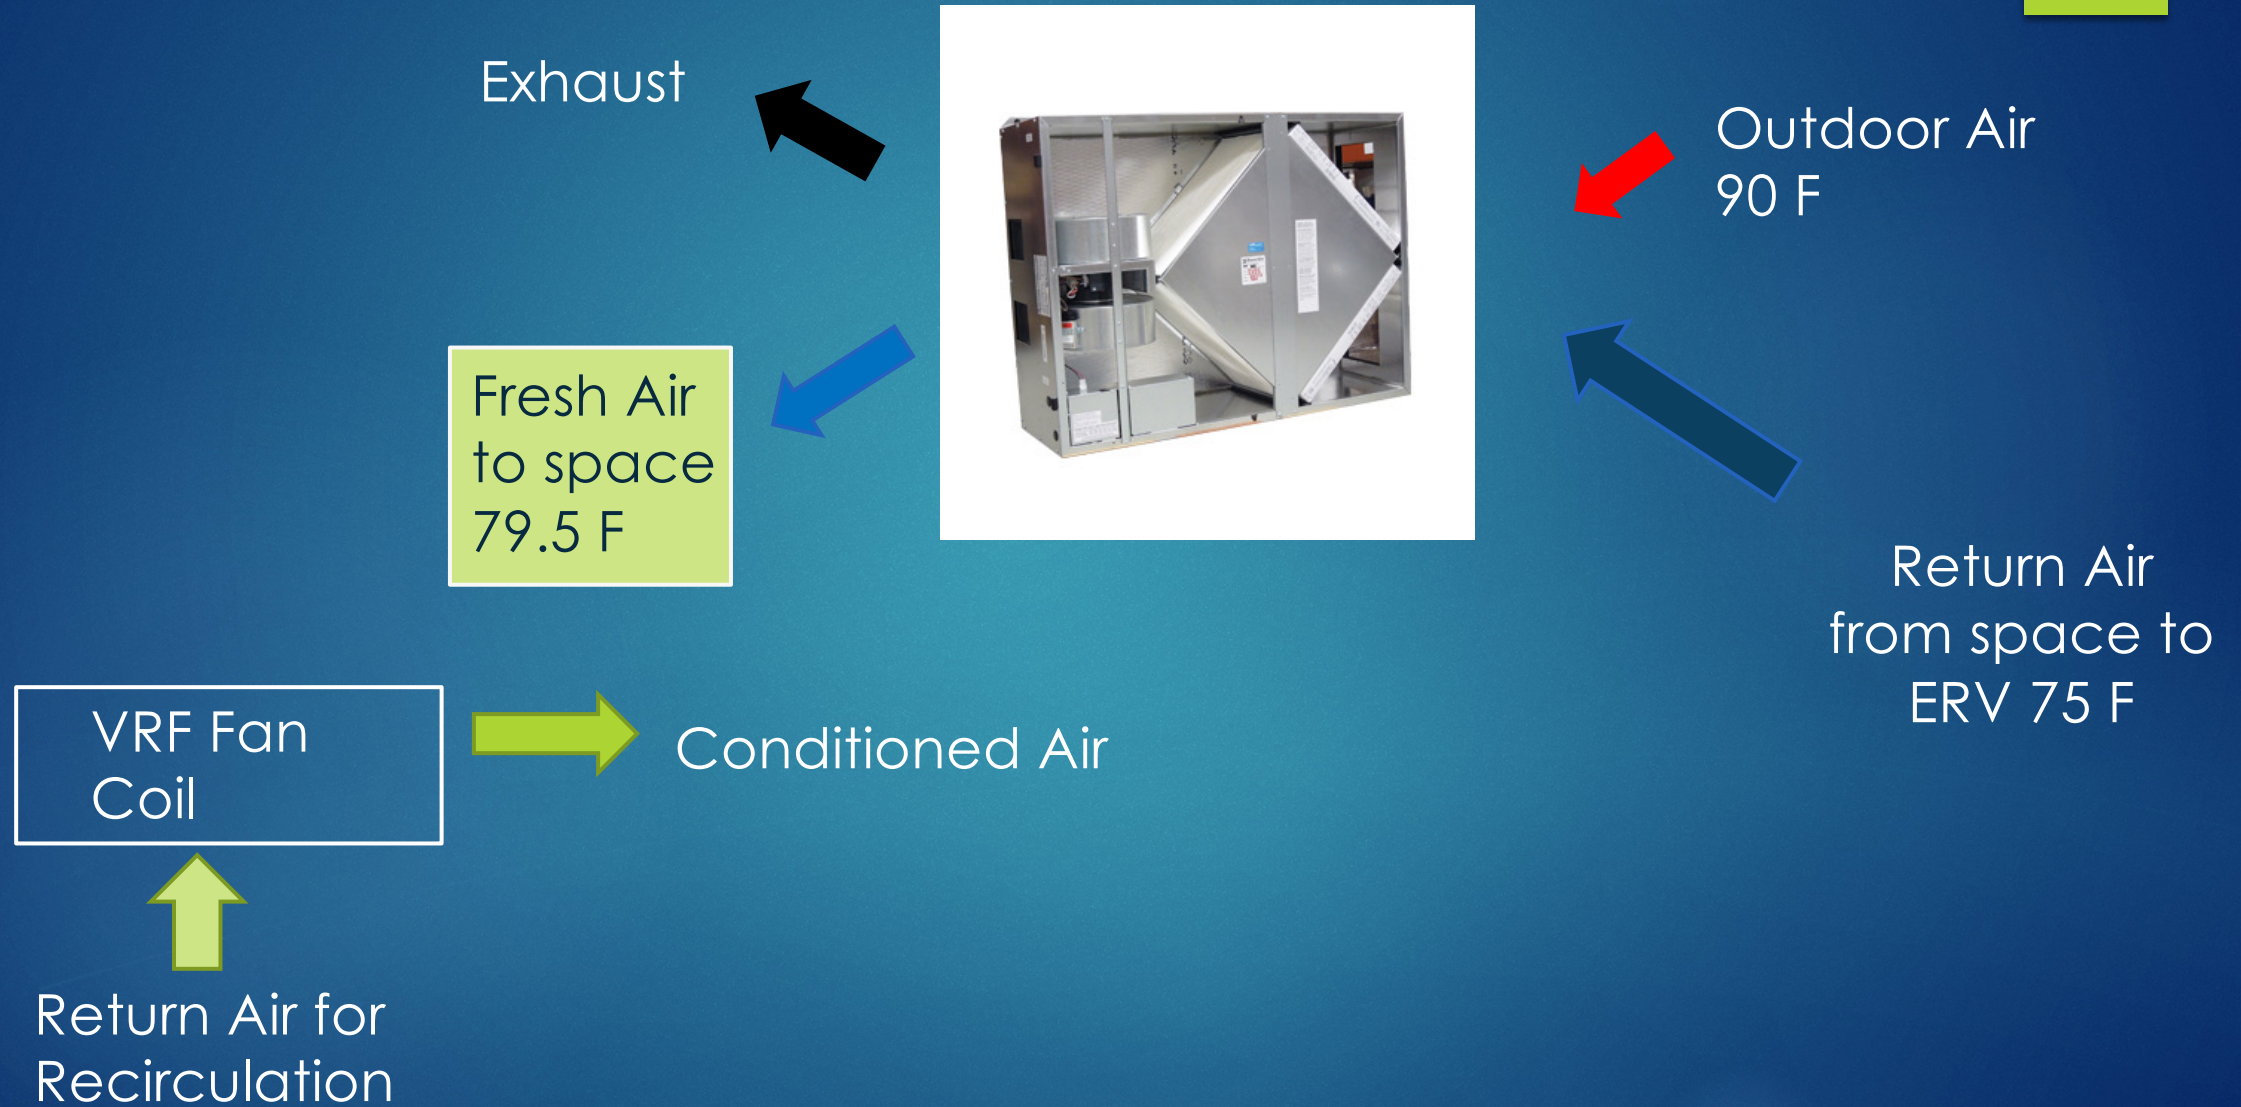

- Reduce cooling equipment tonnage
- Replace traditional ventilation equipment
- Lower operating/energy costs
- Reduce liability issues like mold, mildew and IAQ
- Filtration and balanced airflow in one package

LIFE CYCLE COST CONSIDERATIONS

- FIRST COST
- MAINTENANCE COST AND COMPLEXITY
- EFFECTIVENESS (SENSIBLE AND LATENT)
- FAN OPERATING COST
- OTHER ENERGY CONSUMPTION OF THE ERV
- RELIABILITY AND OPERATING LIFE
- LIFETIME PERFORMANCE – PERFORMANCE DEGRADATION
- UTILITY AND GOVERNMENT REBATES

Design Option: decoupled outdoor air

STATIC PLATE SENSIBLE ONLY HRV

- ▶ Transfers sensible heat only, no moisture transfer
- ▶ Requires condensate drain and humidity sensor
- ▶ Usually made of aluminum or plastic
- ▶ No moisture reduction

STATIC PLATE TOTAL ENERGY ERV

- RELIABLE PERFORMANCE
- SIMPLE MAINTENANCE
- POSITIVE AIRSTREAM SEPARATION
- LAMINAR FLOW – INTERIOR DOES NOT CLOG
- BOTH SENSIBLE (70-75%) AND LATENT (45-55%) TRANSFER
- AT 500 FPM AIR VELOCITY PRESSURE DROP IS 0.62" W.G.
- CROSS-FLOW AIRSTREAMS PASS NEXT TO EACH OTHER, BUT NEVER MIX – AHRI 0% CROSS CONTAMINATION
- HEAT TRANSFER OCCURS VIA SIMPLE CONDUCTION DUE TO TEMPERATURE DIFFERENTIAL

STATIC ENTHALPIC PLATE ERV

- MOISTURE TRANSFER IN VAPOR PHASE THROUGH PLATE MEDIA VIA VAPOR PRESSURE DIFFERENTIAL
- NO CONDENSATE DRAIN, NO FROST CONCERNS
- EASY, LOW COST MAINTENANCE
- DOES NOT SUPPORT BIOLOGICAL GROWTH
- UL-723, NFPA 90A AND 90B WITH LESS THAN 25/50 FLAME SPREAD/SMOKE DEVELOPED RATING
- AUTOMATICALLY MODERATES INDOOR HUMIDITY TO ASHRAE STANDARD 40% - 60% RH
- 0% CROSS CONTAMINATION – AHRI CERTIFIED

RenewAire products

RESIDENTIAL ERV'S COMMERCIAL QUALITY

Several Models with
CFM range 70 to 300

- ◆ Excellent total heat transfer
- ◆ No defrost needed
- ◆ No condensate drain needed
- ◆ Mount in any orientation
- ◆ UL listed for commercial use
- ◆ MERV-8 filters
- ◆ Continuous insulation
